EFFICIENCY
INCREASE YIELDS
REDUCE INPUT
EXPENSES**

Are you happy with your current inputs?

Widely used for commercial applications, our unique Custom Blends are specifically tailored to each grower's particular soil and plant needs. These blends can be comprised of chemical, organic and mineral inputs into a physical or compound blend. A major advantage of our Custom Blends is the increase in fertiliser use efficiency. Pelletising highly mobile and water soluble fertilisers with biologically rich composted poultry manure that is high in carbon, will slow and extend the rate of nutrient release.

This results in both a reduction in nutrient loss, and plant growth being sustained for a longer period of time. Similarly, our ability to include specific trace elements into each blend ensures that soils are not just receiving the major nutrients required for plant growth, but also minor trace elements that may otherwise be lacking and limiting other nutrient availability to your crop.

Additionally, our ability to manufacture smaller sized pellets is conveniently suited to air seeding applications. Our agronomic services work with each grower to review soil & plant analysis and formulate the perfect blend to achieve the best results. Custom blends can be quoted as delivered prices in either bulk loose, bulk bags, or 25kg bags. (Physical blend min order: 4t. Compound blend min order: 10t.)
